

# JEET PATEL

## Node.js Backend Developer

Surat, Gujarat | Open to Relocation | +91 93279 61569 | jeet22522410@gmail.com | linkedin.com/in/jeet-patel-845309202

### PROFESSIONAL SUMMARY

Node.js Backend Developer with 3+ years of hands-on experience designing and optimizing scalable backend systems handling millions of records and thousands of concurrent users. Expertise in system design, database optimization, and building high-performance REST APIs. Proven ability to identify performance bottlenecks, implement efficient solutions, and deploy production-grade features under time constraints. Strong debugger with a track record of reducing query latency by 50% through strategic indexing and data structure optimization. Experienced in working across timezones with international clients and leading technical teams during critical deployments. Passionate about writing clean, scalable code and solving complex backend challenges.

### TECHNICAL SKILLS

**Backend Development:** Node.js, Express.js, REST API Development, Microservices, Scalable System Design

**Programming:** JavaScript (ES6+), TypeScript

**Databases:** MongoDB (NoSQL), Elasticsearch, InfluxDB

**Real-Time & Messaging:** WebSockets, RabbitMQ, Pub/Sub Architecture, Event-Driven Systems

**Caching & Performance:** Redis, Query Optimization, Low-Latency System Design

**Cloud & DevOps:** AWS (EC2, S3), Docker, NGINX, CI/CD, Git

**Security:** JWT Authentication & Authorization, Secure API Design, Transactional Systems

### PROFESSIONAL EXPERIENCE

#### Node.js Developer

Lifemaan | Full-time | Aug 2025 – Apr 2026

- Designed and deployed multiple backend APIs for a paperless hospital management system serving doctors and patients across iOS and Android platforms, eliminating dependency on physical case files.
- Built a high-performance file upload system enabling secure uploads of files up to 15 GB directly to AWS S3, generating time-limited secure credentials server-side and eliminating server bottleneck entirely.
- Architected an asynchronous worker queue system processing medical documents in intelligent batches of 30 records with 10-second rate limiting between batches, ensuring main server responsiveness while handling intensive document operations like image processing and metadata extraction.
- Optimized MongoDB database queries by implementing strategic indexing, embedded data restructuring, and query pattern improvements, resulting in significantly faster API response times under high load.
- Collaborated with cross-functional teams to translate product requirements into scalable backend solutions, delivering multiple feature releases within tight deadlines using AI-assisted development workflows.

#### Software Developer (Team Lead – Night Shift)

Web Code Genie | Full-time | Jan 2023 – Jul 2025

- Developed and maintained three high-impact backend projects: Lead Hunter System (90M+ records), Mario Towing Service (real-time microservices), and Market Analysis Engine (ML-powered stock predictions).
- Designed and optimized RESTful APIs and complex MongoDB and Elasticsearch database queries across all three projects, implementing efficient indexing and data structures to handle high-concurrency workloads.
- Led a team of four developers during night shifts to provide real-time technical support for international clients based in Canada, troubleshooting production issues, deploying critical fixes, and completing urgent feature requests within hours.
- Managed 90M+ customer lead records with a hybrid Elasticsearch and MongoDB architecture enabling sub-second full-text search and fast record retrieval at massive scale.
- Implemented scalable microservices architecture using Node.js, RabbitMQ message queues, Docker containerization, and NGINX reverse proxy to handle high-traffic concurrent requests.
- Shipped multiple features and production fixes while maintaining 99% uptime, ensuring zero data loss during deployments across all client-facing systems.

#### Backend Developer Intern

Web Code Genie | Internship | Jan 2023 – Jul 2023

- Began career building REST APIs and backend services, gaining foundational experience in Node.js, MongoDB, and scalable system design under senior developer mentorship.

### KEY PROJECTS

#### Lead Hunter System | Big Data & Distributed Search

**Tech Stack:** Node.js, Elasticsearch, MongoDB, RabbitMQ, TypeScript, REST APIs

- Designed and built a distributed search backend handling 90M+ records enabling fast lead retrieval for 2,000+ concurrent users.

- Architected a hybrid storage strategy using Elasticsearch for indexed searchable fields (name, email, phone) and MongoDB for complete record storage, achieving sub-second query response times.
- Implemented RabbitMQ message queue system to asynchronously synchronize incoming lead data between Elasticsearch and MongoDB, ensuring data consistency at scale.
- Achieved 50% improvement in search speed through strategic indexing and two-tier data architecture design.

### **Mario's Towing Service | Real-Time Vehicle Tracking Microservices**

**Tech Stack:** *Node.js, Microservices, Docker, NGINX, WebSocket, RabbitMQ, MongoDB, Payment Gateway, SMS APIs*

- Architected a microservices-based backend for a vehicle towing platform enabling users to request towing from breakdown locations to desired destinations.
- Designed independent microservices for request management, real-time GPS tracking, driver assignment, and payment processing, each containerized with Docker.
- Implemented NGINX as reverse proxy to route traffic between microservices and handle load balancing across multiple service instances.
- Integrated WebSocket real-time communication for live vehicle location tracking, driver-customer interaction, payment link generation, and SMS notifications for trip status updates.

### **LifeMaan | Scalable Healthcare Document Management Platform**

**Tech Stack:** *Node.js, AWS S3, Worker Queues, MongoDB, TypeScript, REST APIs, Asynchronous Processing*

- Built backend APIs for a paperless hospital management system enabling digital IPD/OPD record management on mobile and web platforms.
- Designed a high-performance file upload system supporting files up to 15 GB via secure time-limited AWS S3 credentials, enabling direct browser-to-S3 uploads without server bottleneck.
- Engineered an asynchronous worker queue system processing documents in batches of 30 with intelligent 10-second rate limiting, preventing server overload while handling image compression, metadata extraction, and file organization.

### **Market Analysis Engine | Predictive Stock Analytics**

**Tech Stack:** *Node.js, Python, Machine Learning Models, MongoDB, REST APIs, InfluxDB, Real-Time Data Processing*

- Built a high-throughput analytics backend processing 10M+ daily data points for stock trend analysis and market prediction.
- Integrated pre-trained Python ML models to analyze fundamentals, technical indicators, and historical price patterns to forecast stock behavior for given symbols.
- Designed REST API layer serving ML model predictions with optimized caching to handle multiple concurrent prediction requests with low latency.

## **EDUCATION**

---

### **Bachelor of Engineering – Information Technology**

June 2023

*Government Engineering College, Modasa, Gujarat*

CGPA: 7.98 / 10.00
